

# Exception Handling

## (A light introduction)

Tiziana Ligorio  
Hunter College of The City University of New York

# Today's Plan

Motivation

Exceptions (light)

Something should really bother you about the List class...

What?

```
template<class T>
T List<T>::getItem(size_t position) const
{
    Node<T>* pos_ptr = getPointerTo(position);
    if(pos_ptr != nullptr)
        return pos_ptr->getItem();
    else
        //MUST RETURN SOMETHING!!!!
}
```

```
template<class T>
T List<T>::getItem(size_t position) const
{
    T dummy;
    Node<T>* pos_ptr = getPointerTo(position);
    if(pos_ptr != nullptr)
        return pos_ptr->getItem();
    else
        return dummy;
}
```

If there is no item at position, can we just return a dummy object?

```

template<class T>
T List<T>::getItem(size_t position) const
{
    T dummy;
    Node<T>* pos_ptr = getPointerTo(position);
    if(pos_ptr != nullptr)
        return pos_ptr->getItem();
    else
        return dummy; //problem/warning may return
                       // uninitialized object
}

```

The calling function has no way of knowing  
the returned object is uninitialized ->  
UNDEFINED BEHAVIOR

# Fail-safe Programming

What happens when preconditions are not met or input data is malformed?

- Do nothing
- Return false - `bool add(const T& newEntry);`
- Use **sentinel value**: return error codes

# Fail-safe Programming

What happens when preconditions are not met or input data is malformed?

- Do nothing
- Return false - `bool add(const T& newEntry);`
- Use **sentinel value**: return error codes

???

# Fail-safe Programming

What happens when preconditions are not met or input data is malformed?

- Do nothing
- Return false - `bool add(const T& newEntry);`
- Use **sentinel value**: return error codes

Rely on user to handle problem

Rely on user to handle problem

Sometimes it is not possible to return an error code

# Fail-safe Programming

What happens when preconditions are not met or input data is malformed?

- Do nothing
- Return false - `bool add(const T& newEntry);`
- Use `sentinel value`: return error codes

What happens there is no item at position when calling `getItem(size_t position)?`

# Lecture Activity

**What would you do?**

# assert

```
#include <cassert>
```

```
// ...
```

```
assert(getPointerTo(position) != nullptr);
```

Make sure this is true

If assertion is false, program execution terminates

# assert

```
#include <cassert>
```

```
// ...
```

```
assert(getPointerTo(position) != nullptr);
```

Make sure this is true

If assertion is false, program execution terminates

Good for testing and debugging

So drastic! Give me  
another chance!

# Exceptions: A Light Introduction

# Exceptions

Software: calling function

Client might be able to recover from a violation or unexpected condition

Communicate **Exception** (error) to client:

- Bypass normal execution
- Return control to client
- Communicate error

# Exceptions

Client might be able to recover from a violation or unexpected condition

Communicate **Exception** (error) to client:

- Bypass normal execution
- Return control to client
- Communicate error

Throw and Exception

# Throwing Exceptions

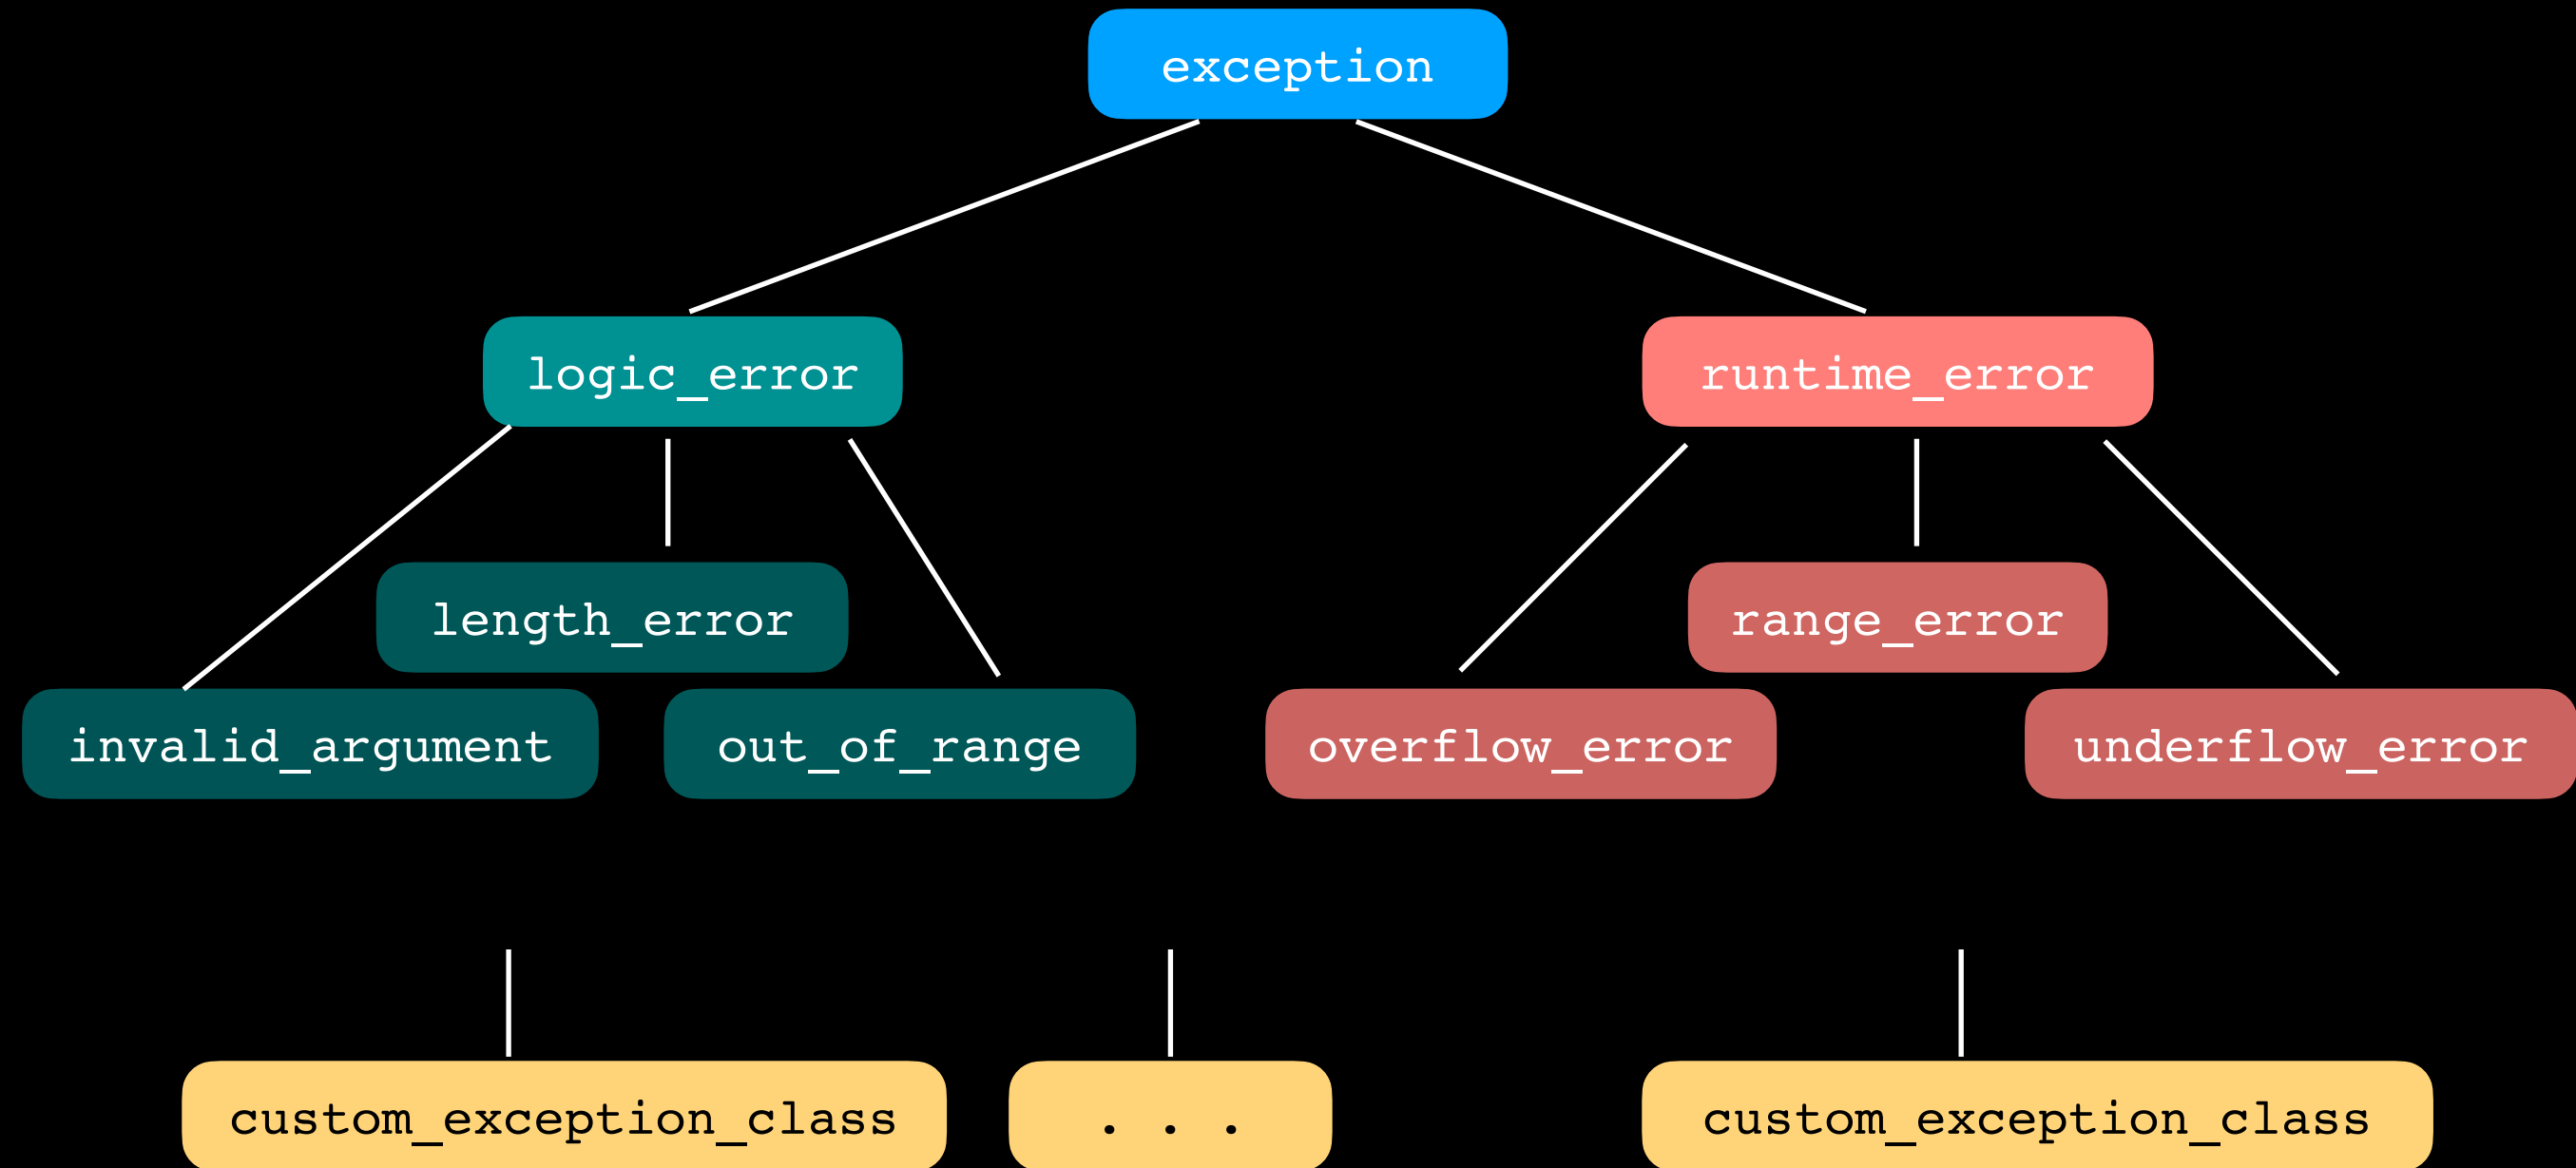

Type of Exception

**throw**( *ExceptionClass*( *stringArgument*) )

Message describing  
Exception

```
template<class T>
T List<T>::getItem(size_t position) const
{
    Node<T>* pos_ptr = getPointerTo(position);
    if(pos_ptr == nullptr)
        throw (std::out_of_range("getItem called with empty list
                                or invalid position"));
    else
        return pos_ptr->getItem();
}
```

# C++ Exception Classes

# C++ Exception Classes

Control returned to  
calling function

exception

Program Terminates

logic\_error

runtime\_error

length\_error

range\_error

invalid\_argument

out\_of\_range

overflow\_error

underflow\_error

user\_defined\_class

...

user\_defined\_class

e.g. `PreconditionViolatedExcep`  
thrown by `List`

Exception Type		Header File
exception		<exception>
bad_alloc		<new>
bad_cast		<typeinfo>
bad_exception		<exception>
bad_typeid		<typeinfo>
ios_base::failure		<ios>
logic_error		<stdexcept>
	length_error	<stdexcept>
	domain_error	<stdexcept>
	out_of_range	<stdexcept>
	invalid_argument	<stdexcept>
runtime_error		<stdexcept>
	overflow_error	<stdexcept>
	range_error	<stdexcept>
	underflow_error	<stdexcept>

# Exception Handling

Can handle only exceptions of class `logic_error` and its derived classes

# Exception Handling Syntax

```
try
{
    //statement(s) that might throw exception
}
catch(ExceptionClass1 identifier)
{
    //statement(s) that react to an exception
    // of type ExceptionClass1
}
```

# Exception Handling Syntax

```
try
{
    //statement(s) that might throw exception
}
catch(ExceptionClass1 identifier)
{
    //statement(s) that react to an exception
    // of type ExceptionClass1
}
catch(ExceptionClass2 identifier)
{
    //statement(s) that react to an exception
    // of type ExceptionClass2
}
. . .
```

# Exception Handling Syntax

Arrange catch blocks in order of specificity,  
catching most specific first  
(i.e. lower in the Exception Class Hierarchy first)

```
try
{
    //statement(s) that might throw exception
}
catch(const ExceptionClass1& identifier)
{
    //statement(s) that react to an exception
    // of type ExceptionClass1
}
catch(const ExceptionClass2& identifier)
{
    //statement(s) that react to an exception
    // of type ExceptionClass2
}
. . .
```

Good practice to catch exceptions by const reference whenever possible  
(due to memory management, avoiding copying and slicing issues)

# Exception Handling Usage

You know getItem() may throw an exception so call it in a try block

```
try
{
    some_object = my_list.getItem(n);
}
catch(const std::out_of_range& problem)
{
    //do something else instead
    bool object_not_found = true;
}
```

```

template<class T>
T List<T>::getItem(size_t position) const
{
    Node<T>* pos_ptr = getPointerTo(position);
    if(pos_ptr == nullptr)
        throw(std::out_of_range("getItem called with empty list or invalid position"));
    else
        return pos_ptr->getItem();
}

```

```

try
{
    some_object = my_list.getItem(n);
}
catch(const std::out_of_range& problem)
{
    std::cerr << problem.what() << std::endl;
    //do something else instead
    bool object_not_found = true;
}

```

Returns string  
parameter to  
thrown exception

#### Error Output Stream:

getItem called with empty list or invalid position

# Uncaught Exceptions

```
template<class T>
T List<T>::getItem(size_t position) const
{
    Node<T>* pos_ptr = getPointerTo(position);
    if(pos_ptr == nullptr)
        throw(std::out_of_range("getItem called with empty list or invalid position"));
    else
        return pos_ptr->getItem();
}
```

out\_of\_range exception  
thrown here

```
T someFunction(const List<T>& some_list)
{
    T an_item;
    //code here
    an_item = some_list.getItem(n);
}
```

out\_of\_range exception  
not handled here

```
int main()
{
    List<string> my_list;
    try
    {
        std::string some_string = someFunction(my_list);
    }
    catch(const std::out_of_range& problem)
    {
        //code to handle exception here
    }
    //more code here
    return 0;
}
```

out\_of\_range exception  
handled here

# Uncaught Exceptions

```
template<class T>
T List<T>::getItem(size_t position) const
{
    Node<T>* pos_ptr = getPointerTo(position);
    if(pos_ptr == nullptr)
        throw(std::out_of_range("getItem called with empty list or invalid position"));
    else
        return pos_ptr->getItem();
}
```

out\_of\_range exception  
thrown here

```
T someFunction(const List<T>& some_list)
{
    T an_item;
    //code here
    an_item = some_list.getItem(n);
}
```

out\_of\_range exception  
not handled here

```
int main()
{
    List<string> my_list;
    std::string some_string = someFunction(my_list);
    //code here
    return 0;
}
```

out\_of\_range exception  
not handled here

Abnormal program  
termination

# Implications

There could be several  
... out of the scope of this course

We will discuss one:

What happens when program that dynamically allocated memory relinquishes control in the middle of execution because of an exception?

# Implications and Complications

There could be many  
... out of the scope of this course

We will discuss one:

What happens when program that dynamically  
allocated memory relinquishes control in the mid ' ' of execution because of an exception?

Dynamically allocated memory never released!!!

# Implications and Complications

Whenever using **dynamic memory allocation** and **exception handling** together must consider ways to **prevent memory leaks**

Memory Leak

out\_of\_range exception  
thrown here

```
template<class T>
T List<T>::getItem(size_t position) const
{
    Node<T>* pos_ptr = getPointerTo(position);
    if(pos_ptr == nullptr)
        throw(std::out_of_range("getItem called with empty list or invalid position"));
    else
        return pos_ptr->getItem();
}
```

```
T someFunction(const List<T>& some_list)
{
    //code here that dynamically allocates memory
    T an_item;
    //code here
    an_item = some_list.getItem(n);
}
```

out\_of\_range exception  
not handled here

```
int main()
{
    List<string> my_list;
    try
    {
        std::string some_string = someFunction(my_list);
    }
    catch(const std::out_of_range& problem)
    {
        //code to handle exception here
    }
    //more code here
    return 0;
}
```

out\_of\_range exception  
handled here

**Possible solution coming soon**
